

Algebra II – Chapter 4

4.1: Graph Quadratic Functions in Standard Form

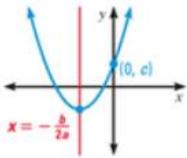

Now we are going to switch from linear equations to quadratic equations. Quadratic equations are in the form: $x^2 + bx + c = y$.

GRAPHING ANY QUADRATIC FUNCTION You can use the following properties to graph any quadratic function $y = ax^2 + bx + c$, including a function where $b \neq 0$.

KEY CONCEPT *For Your Notebook*

Properties of the Graph of $y = ax^2 + bx + c$

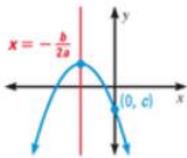

$y = ax^2 + bx + c, a > 0$

$x = -\frac{b}{2a}$

$(0, c)$

$y = ax^2 + bx + c, a < 0$

$x = -\frac{b}{2a}$

$(0, c)$

Characteristics of the graph of $y = ax^2 + bx + c$:

- The graph opens up if $a > 0$ and opens down if $a < 0$.
- The graph is narrower than the graph of $y = x^2$ if $|a| > 1$ and wider if $|a| < 1$.
- The axis of symmetry is $x = -\frac{b}{2a}$ and the vertex has x -coordinate $-\frac{b}{2a}$.
- The y -intercept is c . So, the point $(0, c)$ is on the parabola.

Graph the function. Compare to $y = x^2$. Label the vertex and axis of symmetry. Tell whether the function has a minimum or maximum value and state the value.

1) $y = 5x^2$

2) $y = 4x^2 + 1$

3) $y = 3x^2 - 6x + 4$

4) $f(x) = \frac{1}{2}x^2 + x - 3$

4.2: Graph Quadratic in Vertex or Intercept Form

Standard Form: $y = ax^2 + bx + c$

Vertex Form: $y = a(x - h)^2 + k$

KEY CONCEPT *For Your Notebook*

Graph of Vertex Form $y = a(x - h)^2 + k$

The graph of $y = a(x - h)^2 + k$ is the parabola $y = ax^2$ translated horizontally h units and vertically k units.

Characteristics of the graph of $y = a(x - h)^2 + k$:

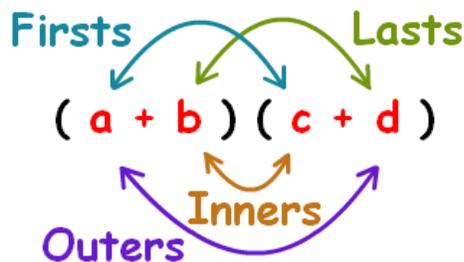

- The vertex is (h, k) .
- The axis of symmetry is $x = h$.
- The graph opens up if $a > 0$ and down if $a < 0$.

1. Graph the function and label the vertex and axis of symmetry:

$$y = (x + 4)^2 + 2$$

$$y = -\frac{1}{4}(x + 2)^2 + 1$$

Remember FOIL and Factoring (unFOIL) ?

2. Write the quadratic function in standard form.

$$f(x) = 4(x + 1)(x - 6)$$

$$y = -(x + 6)^2 + 10$$

4.3: Solve $x^2 + bx + c = 0$ by Factoring

- How can we factor: $x^2 - 3x - 18$?

Some special cases:

Difference of squares: $a^2 - b^2 = (a + b)(a - b)$

Perfect squares: $a^2 + 2ab + b^2 = (a + b)^2$

Perfect squares: $a^2 - 2ab + b^2 = (a - b)^2$

Factor or tell if unfactorable:

1) $x^2 - 7x + 10$

2) $n^2 - 3n + 9$

3) $q^2 - 100$

4) $w^2 - 18w + 81$

Zero Product Property

If $a \times b = 0$ then $a = 0$ or $b = 0$

Solve $x^2 + 7x + 10 = 0$

$$\begin{aligned}x^2 + 7x + 10 &= 0 \\(x + 2)(x + 5) &= 0 \\x + 2 = 0 \text{ or } x + 5 &= 0 \\x = -2 \text{ or } x = -5\end{aligned}$$

Solve $x^2 + 7x = 0$

$$\begin{aligned}x^2 + 7x &= 0 \\x(x + 7) &= 0 \\x = 0 \text{ or } x + 7 = 0 \\x = 0 \text{ or } x = -7\end{aligned}$$

Solve the equation:

5) $x^2 + 2x - 35 = 0$

6) $r^2 + 2r = 80$

4.4: Solve $ax^2 + bx + c = 0$ by Factoring

What happens if we have a number in front of the x^2 term? We still factor!

Practice:

1) $3n^2 + 7n + 4$

2) $4r^2 - 25$

3) $25t^2 - 30t + 9$

One way to help is to factor the monomial 1st...

4) $12x^2 - 4x - 40$

5) $-8y^2 + 28y - 60$

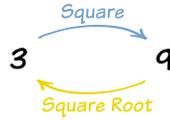

We can also solve if we remember that $A \cdot B = 0$, either $A = 0$ or $B = 0$

6) Solve $14s^2 - 21s = 0$

7) Solve: $4s^2 - 20s + 25 = 0$

4.5: Solve Quadratic Equations Finding Square Roots

Do you remember square roots? Another way to solve quadratic equations is to find the square roots.

There are a few rules for square roots:

- **Product Property:** $\sqrt{a \cdot b} = \sqrt{a} \cdot \sqrt{b}$

- **Quotient Property:** $\sqrt{\frac{a}{b}} = \frac{\sqrt{a}}{\sqrt{b}}$

Practice:

1) $\sqrt{27}$

2) $\sqrt{10} \cdot \sqrt{15}$

3) $\sqrt{\frac{15}{4}}$

4) $\frac{1}{5+\sqrt{6}}$

Solve

5) $5x^2 = 80$

6) $z^2 - 7 = 29$

7) $3(x - 2)^2 = 40$

4.6: Perform Operations with Complex Numbers

What happens when you want to take the square root of a negative number? Imaginary numbers!

$$i = \sqrt{-1} \text{ which means } i^2 = -1$$

So, $\sqrt{-3} = i\sqrt{3}$

You can also have a mixture of real and imaginary numbers, called a complex number, like $3 + 8i$

Practice:

1) Solve: $x^2 + 11 = 3$

2) Solve: $5x^2 + 33 = 3$

When adding/subtracting/multiplying/dividing imaginary numbers, treat the i like a variable, but remember $i^2 = -1$

3) $(9 - i) + (-6 + 7i)$

4) $(3 + 7i) - (8 - 2i)$

5) $-4 - (1 + i) - (5 + 9i)$

6) $6i(3 + 2i)$

7) $(-1 - 5i)(-1 + 5i)$

4.7: Complete the Square

Another method to solve quadratics is to complete the square.

To complete the square for $x^2 + bx$ add $\left(\frac{b}{2}\right)^2$

Practice:

Solve by square roots:

1) $x^2 + 6x + 9 = 36$

2) $x^2 - 10x + 25 = 1$

3) $x^2 - 24x + 144 = 100$

Complete the square:

4) $x^2 + 22x + c$

Solve the equation by completing the square:

5) $x^2 + 6x + 4 = 0$

6) $3x^2 + 12x - 18 = 0$

7) $4p(p - 2) = 100$

4.8: Using the Quadratic Formula and the Discriminant

For any quadratic, you can use the quadratic formula to solve:

Quadratic Formula

To Solve: $ax^2 + bx + c = 0$

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

Eg $2x^2 + 11x + 6 = 0 \Rightarrow a=2 \quad b=11 \quad c=6$

$$x = \frac{-11 \pm \sqrt{11^2 - 4 \times 2 \times 6}}{2 \times 2} \quad x = \frac{-11 \pm \sqrt{73}}{4}$$

$x = -0.614 \text{ or } -4.886 \text{ (3dp)}$

Intersections

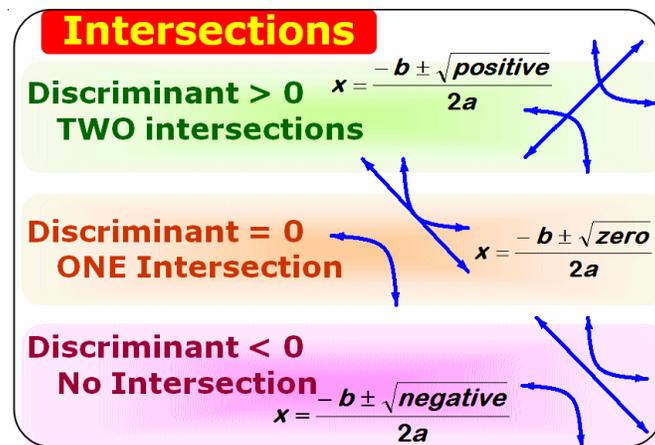

Discriminant > 0
TWO intersections

$$x = \frac{-b \pm \sqrt{\text{positive}}}{2a}$$

Discriminant = 0
ONE Intersection

$$x = \frac{-b \pm \sqrt{\text{zero}}}{2a}$$

Discriminant < 0
No Intersection

$$x = \frac{-b \pm \sqrt{\text{negative}}}{2a}$$

Practice: Use the quadratic formula to solve the equation:

- 1) $x^2 - 6x + 7 = 0$
- 2) $7x - 5 + 12x^2 = -3x$
- 3) Check using factoring: $z^2 + 15z + 24 = -32$
- 4) Find the discriminant and tell the number of solutions: $5x^2 + 16x = 11x - 3x^2$

4.9: Graph and Solve Quadratic Inequalities

We can also graph the quadratic inequalities.

1) $y < -x^2$

2) $y > -2x^2 + 9x - 4$

3) $y \geq 2x^2$ and $y < -x^2 + 1$

4) $y > 3x^2 + 3x - 5$ and $y < -x^2 + 5x + 10$

5) Solve by graphing: $x^2 + 8x \leq -7$

6) Solve by graphing: $-\frac{1}{2}x^2 + 4x \geq 1$

4.10: Write Quadratic Functions and Models

Write a quadratic function in vertex form:

1. Vertex (5, -4) Point (1, 20)
2. Vertex (-1, -4) Point (2, -1)

Write a quadratic function in standard form:

3. (-2, -4), (0, -10), (3, -7)
